

Qualys 8.9.1.2 Release Notes

This new release of the Qualys Cloud Suite of Security and Compliance Applications includes the following fix.

Issues Addressed

- Fixed a cell alignment issue in the CSV output of the Host List Detection API v2 (resource `/api/2.0/fo/asset/host/vm/detection/` with parameter `action=list`).
- Remote vulnerabilities detected by a scanner were mistakenly being closed as Fixed on hosts with cloud agents because cloud agents do not detect remote vulnerabilities. Remote vulnerabilities will no longer be closed based on agent scan processing.
- Fixed an issue where users were seeing empty results in their reports even though they had successful authenticated scans. This was because we were overwriting successful authentication results with failed authentication results. For example, if Windows authentication was successful for a host but Unix authentication on the same host failed.
- Fixed an issue where the root delegation password in the Unix authentication record was being deleted after the user saved changes to the record, which was causing authentication to fail. This has been resolved.
- The iDefense Intelligence tab in the KnowledgeBase section is now visible to Managers only, when this service is enabled for your subscription.
- When you go to Help > Resources you'll now see a Release Notes link that takes you to our Qualys Cloud Suite Release Notes page on the Community where you can get all the latest release notifications in one place.
- Updated the online help to include Oracle version 12 in the list of supported technologies for Oracle Authentication.
- Updated the online help to add the fd prefix to the list of supported address types for IPv6.
