Qualys Certificate View Platform

New API Function to Fetch more than 10000 Certificates

Qualys Certificate View 2.10.0 brings you many more improvements and updates! Learn more

Qualys Certificate View Platform

New API Function to Fetch more than 10000 Certificates

- We have updated the limit for fetching the certificates. If you need to fetch certificate search results that exceed 10000 certificates, you can use this v2 version of List CertView Certificate API (v2). The response contains certificate details, including associated host information and SSL/TLS related vulnerabilities and grades.
- Use this API to retrieve certificates. You can use various filters to search for the required result. You can use multiple filters and parameters. For detailed information, refer to API Release Note.

Issues Addressed

With this release, we have done multiple enhancements for performance improvement.

- We fixed an issue where the field **Description** in **Report Details** was not correctly displaying. It is an optional field but appears as a mandatory field.

- We fixed an issue where the **API Details** pop-up window in the **Certificate Information** page was not closed if the user chose not to enter any API key. The pop-up closes only upon clicking the **Cancel** button.

- We fixed an issue where the user could not download the report for the asset that did not have the grading details of the certificate.
