Qualys Cloud Platform v2.x

Release Notes

Version 2.41.1
October 15, 2019

Qualys Cloud Platform 2.41.1 brings you the following improvements:

WAS   **Web Application Scanning**

- Generating a web application report using tags resulted in an error. We have now fixed the error so that generating a report using tags is now successful.

- Canceling a retest scan displayed an error in some scenarios. We have now fixed the issue so that canceling a retest of a scan, cancels the retesting as expected and does not display any error.

- When Burp file was associated with a web application, the web application report in XML format displayed only an error message. We have now fixed the issue so that the web application report in XML format is correctly displayed.

- Removal of Burp Log file from a web application displayed two error messages instead of one. We have now fixed the issue so that correct validation message is displayed on the UI.

- The authentication status for scans with selenium script was incorrectly displayed as 'Not Used' on detection of QID 150006. Now, we have fixed the issue so that the authentication status is correctly reflected for the scan despite the scan configuration using selenium scripts.

Qualys Cloud Platform

- The "Current State" filter on the Asset Details > IOC tab is now called "Active View". The Active View filter shows incident data for the present state of the system (not historical data).

- Fixed an issue where incorrect video tutorial was shown on the CloudView home page. Now the home page contains the correct video tutorial.

- Fixed an issue where user was not able to access the Admin module in spite of having all the required permissions.
