Qualys 8.10.0.1 Release Notes

This new release of the Qualys Cloud Suite of Security and Compliance Applications includes the following fixes.

Issues Addressed

- For the VM Detection API we reverted the behavior for the active_kernels_only=1 parameter and updated the documentation. Now it excludes vulnerabilities found on non-running Linux kernels. The 8.10 API Release Notes has been updated to reflect this change.

- Scan Reports in CSV format – Now the EC2 Instance ID column will only appear when your subscription has EC2 Scanning enabled and only when the "EC2 Related Information" option is selected in the scan report template. Columns for EC2 Instance ID and EC2 metadata information now appear at the end. We also moved the columns in the CSV output for the VM Detection API. The 8.10 API Release Notes has been updated to reflect this change.

- We fixed an issue where users were getting an error when using the show_pci_flag parameter with the KnowledgeBase Download API (/msp/knowledgebase_download.php).

- We fixed an issue in the Qualys UI where the Scan List was not loading for Non-Manager users.

- We fixed a link in the online help for the Cloud Agent Mac Install Guide.
