Qualys Cloud Platform (VM, PC) v8.x

Release Notes

Version 8.13.1

April 30, 2018

This new release of the Qualys Cloud Platform (VM, PC) includes the following fixes.

Issues Addressed

- Fixed an issue that prevented users from being able to decline the service agreement if needed during subscription activation. Earlier, the change password dialog box popped up preventing the user from declining the service agreement.
- The selection of ports in option profile decides if the ports are included in VM scan processing or not.
- Fixed an issue in Asset Search Report where users got an error when searching an IP address that exists only in their PC license.
- Now Scorecard Report will display the correct count of Scanned hosts when date filter is applied.
- Now the correct IP count is displayed on the scan preview page even when the scan is paused and then resumed.
- All scanner appliances in a TagSet are now used with the correct IP and scanner association.
- Fixed an issue where the Edit Hosts window showed multiple copies of same tables when trying to update hosts having duplicate entries for IP, DNS, and NetBIOS tracking methods.
- We now display an appropriate message if while adding or editing IPs we encounter duplicate hosts or entries like IP tracked / DNS or NetBIOS.
- We have now removed limitation of 3900 ASCII characters for Asset Groups field in Asset Search.
- We fixed an issue related to adding IPs to a business unit's asset group. The asset group name is now displayed in the confirmation screen and the new IP addresses are also correctly displayed in the Host Assets list.
- We have now removed the separate link to download the virtual scanner appliance for Microsoft Azure Classic Image targeted for ASM platform.
- Made updates to the online help for Unix File Content Checks to explain that the regular expression entered in the Scan Parameters section must follow "Basic Regular Expression (BRE)" standard as supported by a "grep" command on specific Unix platforms.
- Updated the help for scan report templates to clarify that the "Exclude superseded patches" filter only applies when Host Based Findings is selected.
