Removal of Restrictions on External ID for AWS Connectors

We have removed the validation for the three-part external ID format check, and the AWS connector can be created using alphanumeric external ID formats.
We have retained the following validations:
- External ID length should be at least 2 characters.
- External ID length should not exceed 1024 characters.
- No space should be present between external ID string.

You can still follow the recommended format displayed above but it isn't mandatory to proceed with creating your connector.

Issue Fixed In This Release

- We fixed an issue where the account alias was not displayed in connector details if there was any unauthorized regions. Currently, the account alias is only set to null if the account has no region authorized.
