

Qualys Container Security

Release Notes

Version 1.16

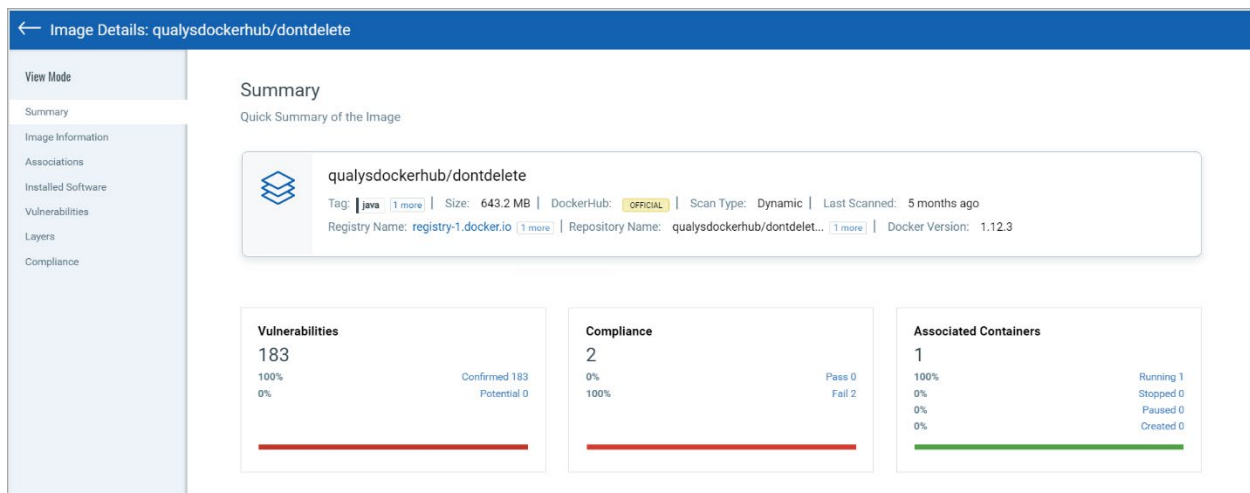

June 14, 2022

Here's what's new in Container Security 1.16!

UI Improvements When Viewing Details

You'll notice improvements when viewing details for various configurations and assets in the Container Security UI. For example, you'll see a better layout and design when viewing details for Sensors, Images and Containers. This new design fixes a few usability issues and makes the information easier to read.

In the Image Details shown below, you'll see that the header information on the Summary tab has a new look & feel, and the Vulnerabilities, Compliance and Associated Containers boxes are now aligned.

Also, you can click the “1 more” link (or “2 more”, “3 more”, etc.) when it appears next to any field in the Summary like Tag, Registry Name or Repository Name to see additional details in a small pop-up next to the item. This way you have all the information right where you need it.

In the example below, the “1 more” was clicked next to Registry Name.

The screenshot shows the 'Image Details' page for the image `qualysdockerhub/dontdelete`. The page has a blue header with a back arrow and the title 'Image Details: qualysdockerhub/dontdelete'. On the left is a sidebar with 'View Mode' and a list of sections: Summary, Image Information, Associations, Installed Software, Vulnerabilities, Layers, and Compliance. The main content area is titled 'Summary' with the subtitle 'Quick Summary of the Image'. It features a summary card for the image, which includes a Docker logo, the image name, and various metadata. A tooltip is visible over the 'Registry Name' field, showing a dropdown menu with 'registry-1.docker.io' and 'docker.io'. Below the summary card are three metrics cards: 'Vulnerabilities' (183 total, 100% confirmed, 0% potential), 'Compliance' (2 total, 0% pass, 100% fail), and 'Associated Containers' (1 total, 100% running, 0% stopped/paused/created). Each card has a progress bar at the bottom.
