

Container Security v1.x

Release Notes for Jenkins Plugin

Version 1.4.3.0

December 4, 2018

Here's what's new in the Jenkins Plugin for Container Security!

[Build failure by Software](#)

[Critical evaluation summary in reports](#)

Build failure by Software

Along with Vulnerabilities, QIDs, and CVEs, you can now fail the docker build if specific software is found in the image. In the build fail conditions in global/job specific config, you can specify a comma separated list of software names with or without version numbers. If this software is found, the build fails.

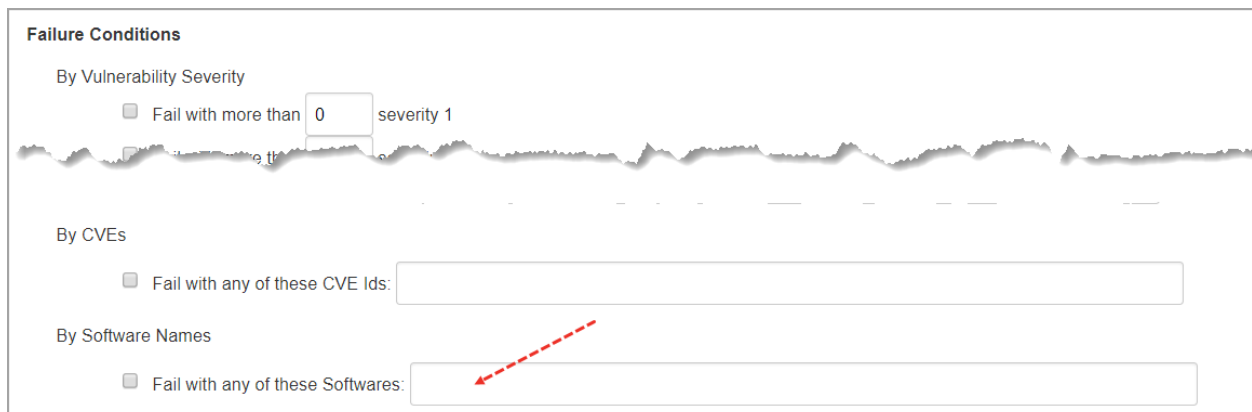

Provide software names in the format:

Name only:

rpm-libs

Name + version:

Rpm-libs=4.8.0-55.el6

Criterial evaluation summary in reports

The Qualys report for Jenkins will now show the criteria against which the image got evaluated for build failure.

The Criterial Evaluation table shows whether the criteria is configured or not, and the respective fail/pass result.
