Qualys Container Security

Release Notes for Sensor

Version 1.27
July 25, 2023

What's New?

Build (CICD) Sensor Supports Containerd Runtime

The CICD sensor is now supported on containerd runtime. To tag CICD images with `qualys_scan_target:<tag>` to mark them for scanning, use the **nerdctl** tool.

```
nerdctl -n k8s.io tag <image-repo:tag> qualys_scan_target:<tag>
```

For example,
```
./nerdctl -n k8s.io tag docker.io/library/known:latest
qualys_scan_target:known
```

Notes:
- The **nerdctl** binary must be available on the host.
- You must create target images in the k8s.io namespace only.

For more information, see Sensor Deployment Guide.
