Container Security v1.x

Release Notes for Sensor

Version 1.2.4
February 21, 2019

Here's what's new in the Container Security Sensor!

Command line parameter to print Sensor logs to the console

While installing the Container Sensor, you can use the `--enable-console-logs` command line parameter to enable printing Sensor logs to the console. You can then retrieve these logs using the docker logs command on the docker host.

Fixed Issue

Fixed an issue where the Container Sensor crashed as it failed to parse the cgroup file to get the container ID.
