Qualys File Integrity Monitoring v2.x
Release Notes

Version 2.0.2
December 19, 2019

Qualys FIM 2.0.2 brings you the following improvements:

- We fixed an issue where manifest generation used to fail if asset count in the profile (or tag) was more than 10K. With FIM 2.0.2.0 release, customers can now assign a tag containing more than 10K assets to a profile. FIM will generate manifest for all these assets.

- We fixed an issue where it was not possible to ignore events based on certain filters. Now when you apply ignore events, the selected events are ignored and added to the list of ignored events.

Known Issue

- If a tag that is assigned to a profile is deleted from Asset View, the action does not get propagated to FIM. Assets that are part of deleted tag would continue to have previously assigned FIM manifest to them and would continue to monitor file system changes based on manifest. Workaround is to first remove the tag from FIM profiles, wait for 30 minutes for new manifests to get published and then delete the tag from Asset View
