Qualys File Integrity Monitoring (FIM)
Release Notes

Version 3.0.1
June 09, 2021

Here are the improvements in File Integrity Monitoring 3.0.1!

- Results on Assets page now appear correctly. Earlier, only 50 records were displayed and clicking Next button did not display the next set of 50 records.
  The Previous and Next buttons for pagination work as required now. User can move to next or previous set of 50 records using Next and Previous buttons respectively.

- On the Event listing page, by using the Group By option, the user was able to view only 50 Grouped Assets. Now, we are showing a maximum of 1000 grouped assets by removing pagination. Ideally, it is recommended to group the assets in a minimum range period (i.e Today, Yesterday, last 7 days, and date range in between 7 days).
  Two asset details (columns), **Agent Id** and **Operating System** are dropped from the UI to enhance the performance.
  When the user downloads the record list, the CSV sheet will contain all (upto 1000) records that are seen in **All events** tab.

- Detailed information of rules on Rule Details page now appear correctly. Earlier, while editing an already created rule without saving the profile resulted in display of blank Rule Details page. This issue has been corrected now.

- Users can now sort the details on Asset tab according to Asset Name. In assets tab, sorting on Asset Name was not working earlier. This has been resolved.
