

Qualys File Integrity Monitoring

Release Notes

Version 3.7.1

July 13, 2023 (Updated on 28 July 2023)

What's New?

[Added Validation on Event Count for Manual Incident](#)

[Added Validation on the Count of Events that can be Ignored](#)

[Introduced Two Search Tokens for Attribute Events](#)

Issue Addressed

Qualys File Integrity Monitoring 3.7.1 brings you many more improvements and updates! [Learn more](#)

Added Validation on Event Count for Manual Incident

We noticed performance issues due to an unrestricted count of events in the manual incident. Additionally, it affected the processing of FIM events on the platform. Therefore, we added the limitation on the number of events while creating manual incident. With this release, manual incident can be created with up to 100k events.

Added Validation on the Count of Events that can be Ignored

With this release, you can now ignore a maximum of 100k events at a time. This enhancement improves the processing of FIM events on the platform.

Introduced Two Search Tokens for Attribute Events

With this release, you can now filter the events based on changes made in the attributes of a file or directory.

| Token | Description | Example |
|-------------------------|---|-------------------------------|
| file.attribute.hidden | Display events of attribute action for file or directory whose hidden attribute is selected or cleared. | file.attribute.hidden:added |
| file.attribute.readonly | Display events of attribute action for file or directory whose readonly attribute is selected or cleared. | file.attribute.readonly:added |

Issue Addressed

With this release, we have fixed the profile-related QQL tokens that caused inconsistency in the alert generation of emails.
