New QQL tokens for Custom Attributes

Global AssetView/CyberSecurity Asset Management 2.14.1 brings many more improvements and updates! Learn more
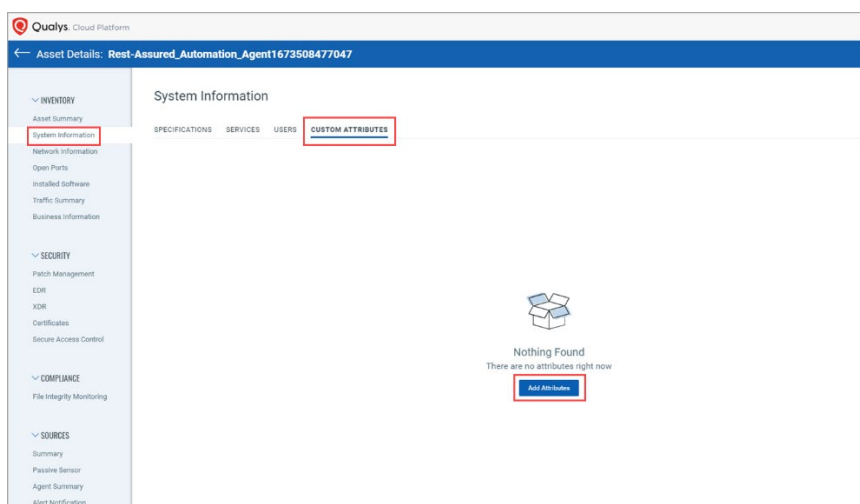

Introduced Custom Attributes for an Asset CSAM

With the CSAM 2.14.1.0 release, we have introduced a new feature, "Custom Attributes" for an asset. The custom attributes you add for assets enable you to filter your assets. For more information, see New QQL tokens for Custom Attributes.

Note: This feature is available only for users with a Trial or Paid subscription. The following message is shown for users with a free account.

When you click the **System Information** tab from the **Inventory** section from the left pane of the Asset Details page, you can see the new **CUSTOM ATTRIBUTES** tab.

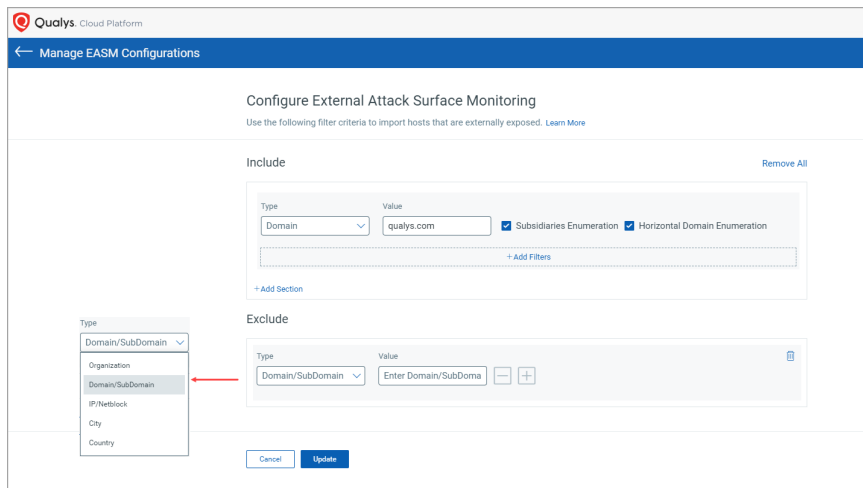

You need to specify a Key and a Value for a custom attribute. The maximum number of custom attributes you can define for an asset is 20.
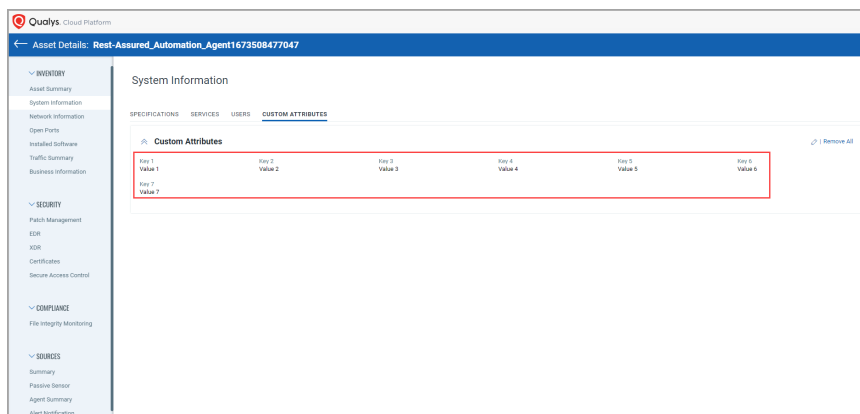

Introduced EASM Configuration Profile Exclude Criteria Limit `CSAM`

With the CSAM 2.14.1.0 release, we have set a limit for the exclusion criteria. You can now exclude a maximum of 250 Domain/Subdomains and 1000 IP/Netblocks. For more information, refer to the Online help.

Introduced EASM Configuration Profile Seed Filter Character Limit `CSAM`

With the CSAM 2.14.1.0 release, we have set a limit for the Seed Type for Include and Seed Type for Exclude filters. For more information, refer to the Online help.

Seed Type for Include

Filter	Character Limit
Organization	4000
Domain	4000
IP/Netblock	4000
Certification Subject	4000

Seed Type for Exclude

| Filter	Character Limit
Organization	4000
Domain/SubDomain	4000
IP/Netblock	4000
City	100
Country	4000

Shodan Activation Not Supported for New Users `CSAM`

Before the CSAM 2.14.1.0 release, for users with a trial or paid subscription, if Shodan or EASM was not activated, the **Assets Visible on Shodan** tile was shown on the CSAM home page.

With the CSAM 2.14.1.0 release, Shodan activation is no longer supported for new users with a trial or paid subscription.

Note: The existing users who activated and configured Shodan can continue using it.

As shown in the following screen capture, for new users, the **Assets Visible on Shodan** tile is no longer available on the Home Page. Instead, the **External Attack Surface** tile is available.
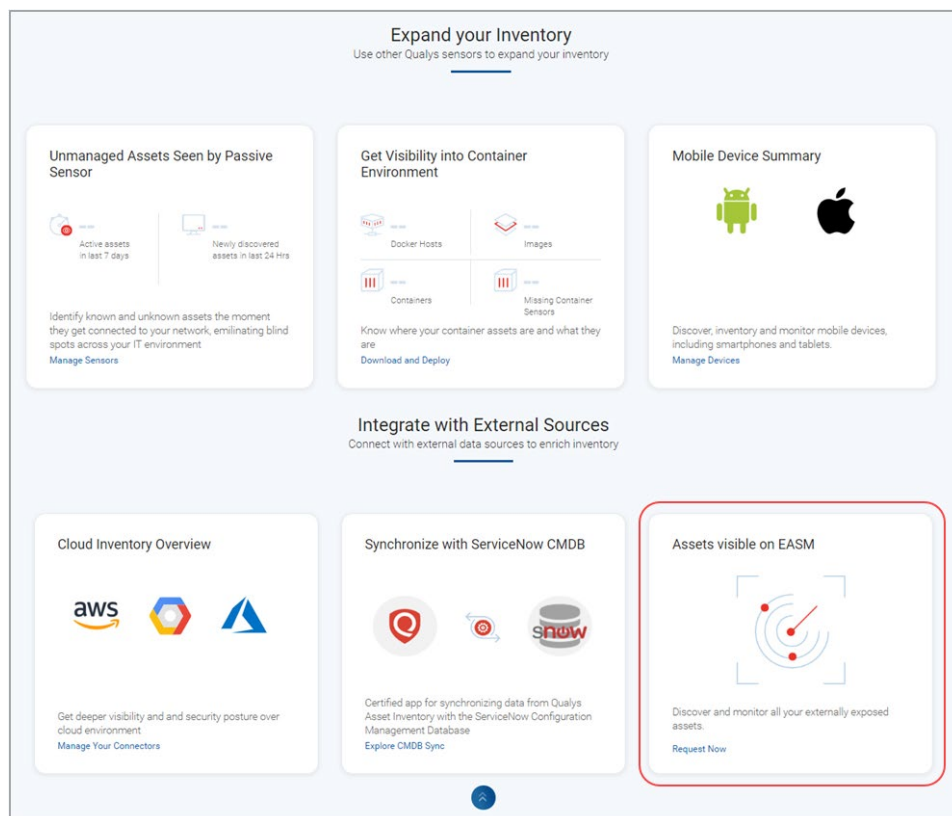

New QQL tokens for Custom Attributes CSAM

With the CSAM 2.14.1.0 release, we have added the following new tokens. You can use these tokens from the **INVENTORY, EASM**, and **DASHBOARD** tabs.

These tokens enable you to filter your assets using the custom attributes that are defined for the assets.

- **customAttributes.key:** This token enables you to filter your assets based on the key you entered as part of the custom attribute.
- **customAttributes.value:** This token enables you to filter your assets based on the value you entered as part of the custom attribute.
- **customAttributes.connectorId:** This token enables you to filter your assets based on the connector Id. Enter the connector Id as 0, which is the default connector Id.

Issues Addressed

We fixed an issue where the report downloaded from the EASM tab didn't include any data.
