

Qualys Patch Management

Release Notes

Version 1.4.2.1

June 26, 2020

Here's what's new in Patch Management 1.4.2.1!

[Include Assets with Multiple Matching Tags in Deployment Job](#)

**Qualys 1.4.2.1 brings you more
improvements and updates! [Learn more](#)**

Include Assets with Multiple Matching Tags in Deployment Job

While creating a deployment job, you can now specify to include only those assets in the patch deployment job that have "ALL" the selected tags. To select this option, go to Jobs > Create Job > Deployment Job. In the Create: Deployment Job screen, go to Select Asset tabs and Select All from the drop-down in "Include hosts that have". For example, select "America" AND "Client" AND "IT Support" tags to deploy patches on assets that have all the three tags.

Currently, we support "Any" option that includes assets that have any of the selected tags.

← Create: **Deployment Job**

STEPS 2/6

- 1 Basic Information
- 2 **Select Assets**
- 3 Select Patches
- 4 Schedule
- 5 Options
- 6 Confirmation

Select Assets

Select the assets you want this job to deploy patches on.

Include the following assets. [Select Assets](#)

There are no assets selected

Issues Addressed

- We fixed an issue where in the Patches tab, patches were shown both as missing as well as installed for agents. After the fix, the patches are shown either installed or missing for agents.
- We fixed an issue where the status of a job in the Jobs tab was not matching with the status shown for the job in the Job details screen. After the fix, we show same status for a job both in the Jobs tabs and in the Job Details screen.
