October 26, 2020

Here's what's new in PCI Compliance 5.10!

[Show Warning Message When Generating Non-Compliant Report](#)

[Ability to Cancel Scans in Launch Requested and Finished In Process States](#)

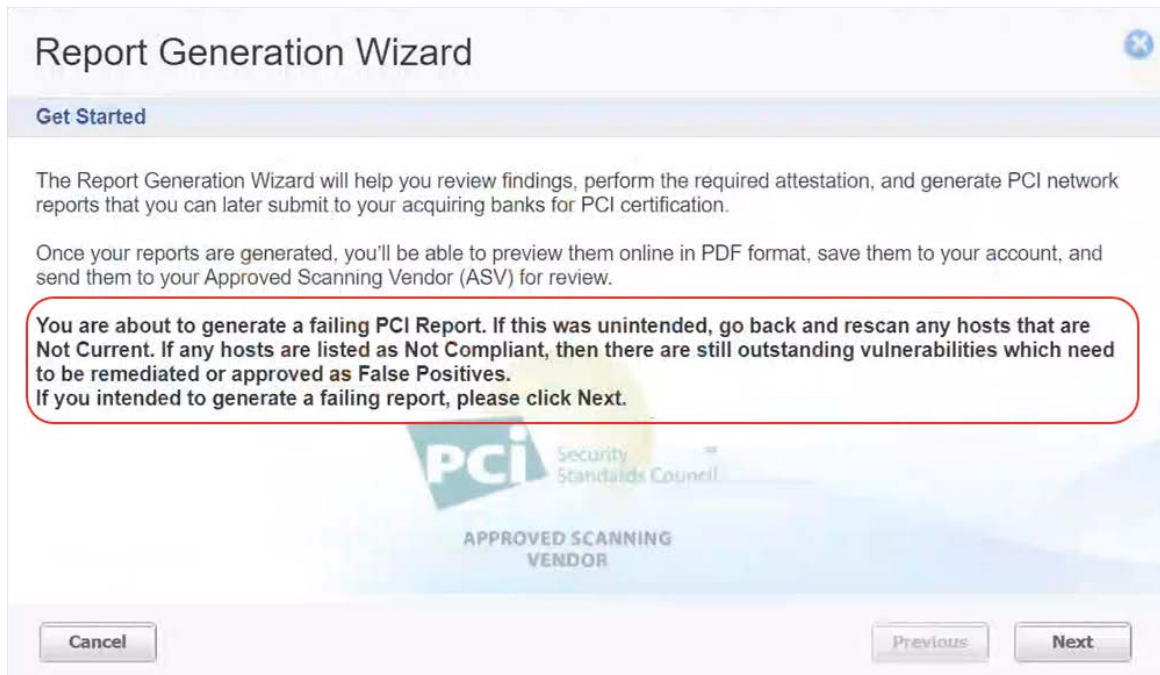

### **Qualys 5.10 brings you more**

improvements and updates! [Learn more](#)

## Show Warning Message When Generating Non-Compliant Report

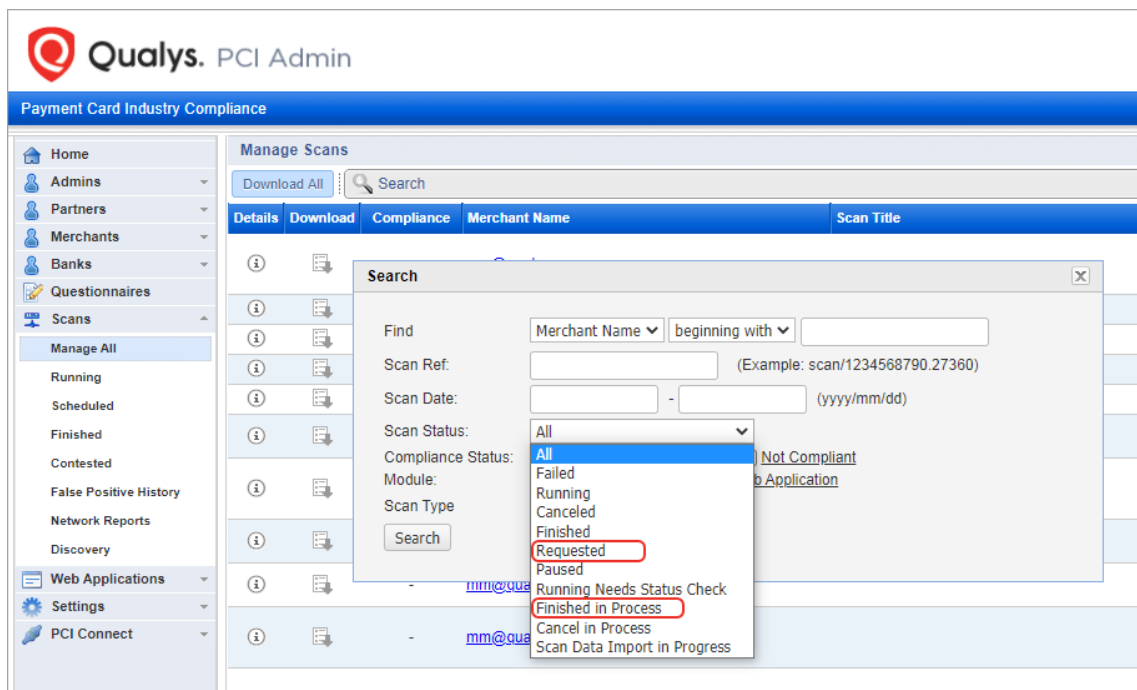

We will now show a warning message when you generate a PCI compliance report that is Not PCI compliant. The message will inform that you are about to generate a report for PCI scan that has hosts with vulnerabilities. We recommend you to either mark the vulnerabilities as False Positives or remediate them, then rescan the hosts. Click Next to generate the report.

To generate a report, **Compliance > Compliance Status > Generate**.

## Ability to Cancel Scans in Launch Requested and Finished In Process States

We now provide an option to PCI admin user to cancel scans that are stuck in the Launch Request status or in Finished In Process status for more than 24 hours. To cancel a scan, go to **Scan > Manage All**. Search for scans that are in **Launch Requested** or **Finished in Process** states. Click the **Search** link, then on the **Search** screen, select **Requested** or **Finished in Process** state from the **Scan Status** field.

## Issues Addressed

- We fixed an issue where an error message "PCI account is already linked to the VM subscription" was shown when a newly created VM user is linked to the PCI account. This issue occurred when a VM user linked to a PCI account was deleted without breaking the link to the PCI account. We now automatically delink the PCI account of a user when you delete the user from the VM UI.
