

Qualys Network Passive Sensor v1.x

Release Notes

Version 1.2.2.1

January 11, 2021

Here's what's new in Qualys Network Passive Sensor 1.2.2.1!

With this release, we've fixed an issue where users of the Global IT Asset Inventory were facing delay in asset update in the "Unmanaged" Inventory with respect their OS prediction because of issues in the Network Passive Sensor (PS) appliance.

An incorrect deployment scenario where multiple sensors sniff the same traffic/assets cause the PS appliance to imply that same assets are migrating across multiple sensors in quick succession resulting in high consumption of computing resources on cloud servers.

To address this issue, we've done following improvements in Network Passive Sensor:

- Improvements in the fingerprinting of assets that communicate using OT protocols.
- Improvements in the Network Passive Application to optimize the load in reporting open ports and operating system of the asset
